**Immunosuppression and Human Malignancy (Contemporary Immunology)** David Naor, Benjamin Y. Klein, Nora Tarcic, Jonathan S. Duke-Cohan

The immune system can deal effectively with the majority of viruses and bacteria, less effectively with parasites, and very poorly with cancer. Why is this so? Why are McFarlane Burnet's and Lewis Thomas' predictions that the immune system is involved in ridding the body of cancer cells, encapsulated in the catchy phrase "immunologic surveillance," so difficult to experimentally establish? Cancer differs from infectious agents in being derived from the host. Hence, it has been postulated that cancer cells lack antigens that the immune system can recognize. They are not "immunogenic." However, this argument is seriously weakened by the existence of numerous human autoimmune diseases, in which the immune system effectively recognizes and attacks a variety of self tissues. Thus, the potential clearly exists for recognition of the surfaces of tumor cells. Professor Naor and his colleagues have written a book that explores another possible reason: cancer cells are recognized by the immune system-but is it possible that the consequence of recognition is inhibition of the immune system-by suppressor T cells or macrophages? The evolution of the malignant state may only occur in individuals who develop this suppression. This book reviews the evidence that suppressor cells, poorly characterized and difficult to study, may be of fundamental importance in cancer. In fact, our incapacity to understand the nature of suppressor cells and their mode of action is one of the major problems in immunology research today.
